Web-client performance check

It is necessary to test the system in order to make sure the settings were correct. After user authentication in the Web-client and selection of the encryption certificate we recommend sending a test message. Below given an example of sending the **Statement request** message.

At first use should go to the **Preparation** section (Fig. 1.1) and choose the **Statement request** message form (Fig. 1.2).

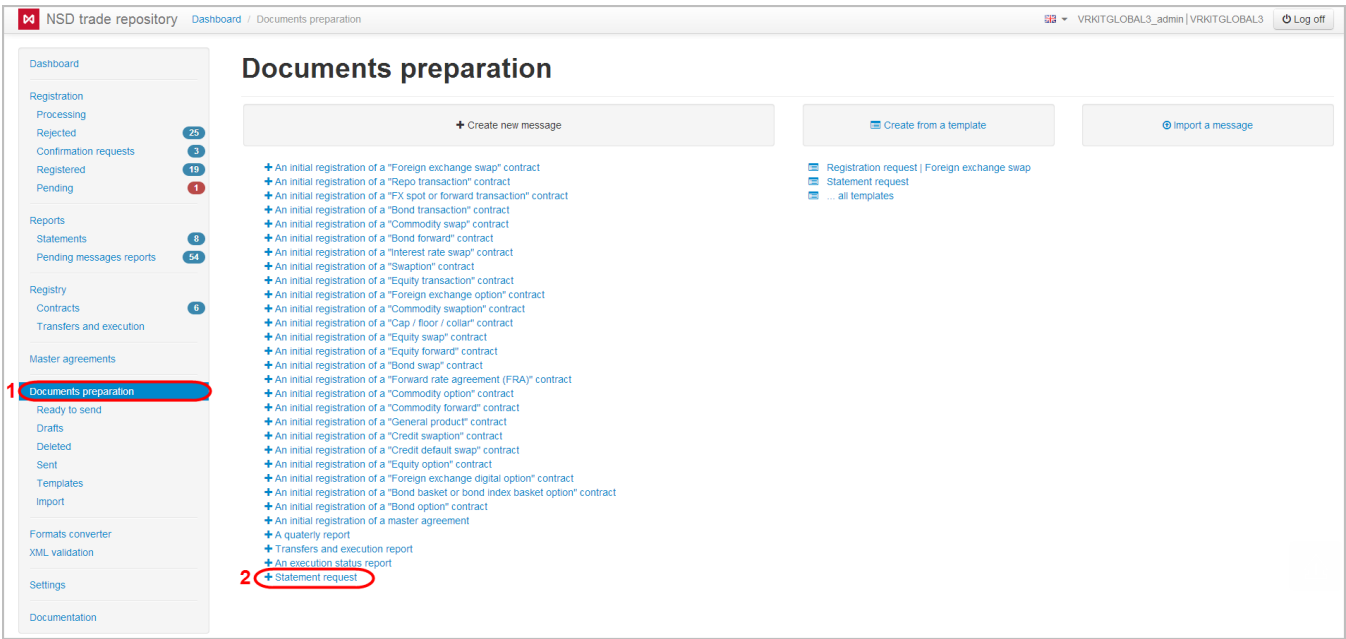

Fig. 1 – Preparation Section

This will open a create/edit message form. Fill in the fields (Fig. 2.1), check the correctness of data input by clicking **Validate** (Fig. 2 .2). If the form is filled out correctly, click **Send** (Fig. 2.3).

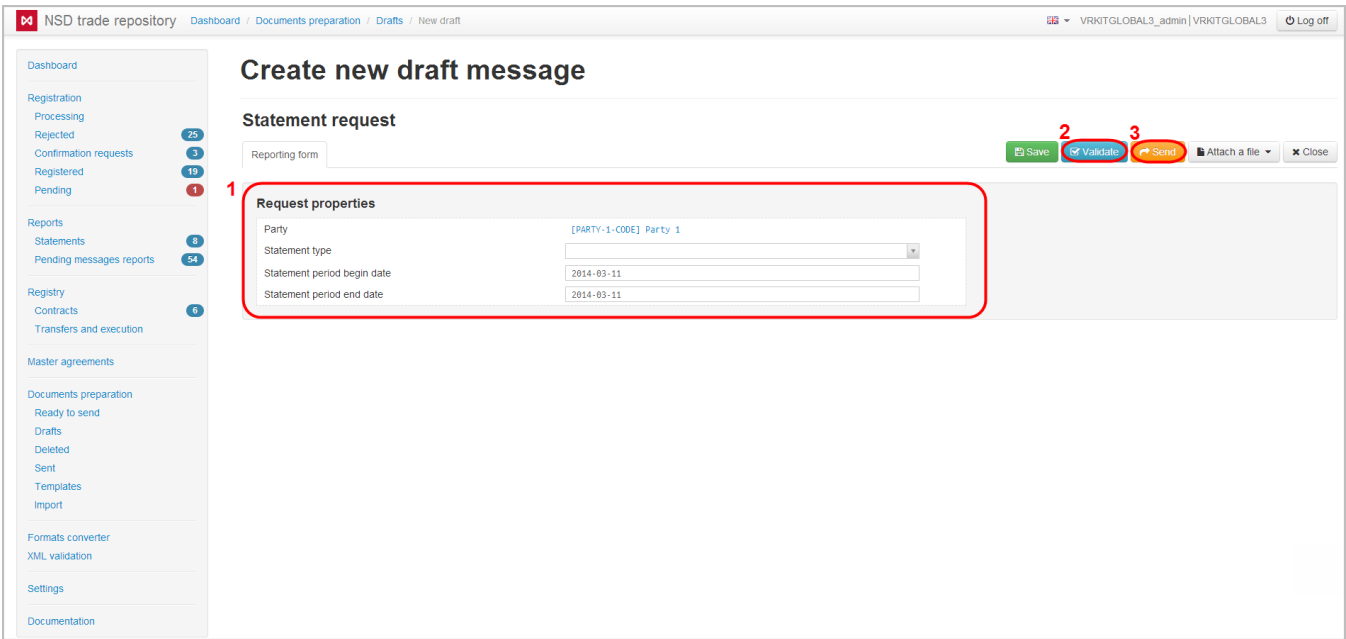

Fig. 2 – sending message

Sent message will appear in the list on the Sent form in Registration area. If the system's response to the Statement requests is in the Statements form or Rejections form; the Web-client is up and running.
