Java API

To make Java applet work with Certificates storage, the user must install the appropriate **Java API.**

> ⚠ Java applet is not enabled in the Chrome web browser version 42. We advice you to set the ActiveX plugin (see ActiveX plugin installation for Internet Explorer).

To do this, download the Java API package (download link) and run the installation file. This opens a security Windows OS window (Fig. 1), where you need to click Run.

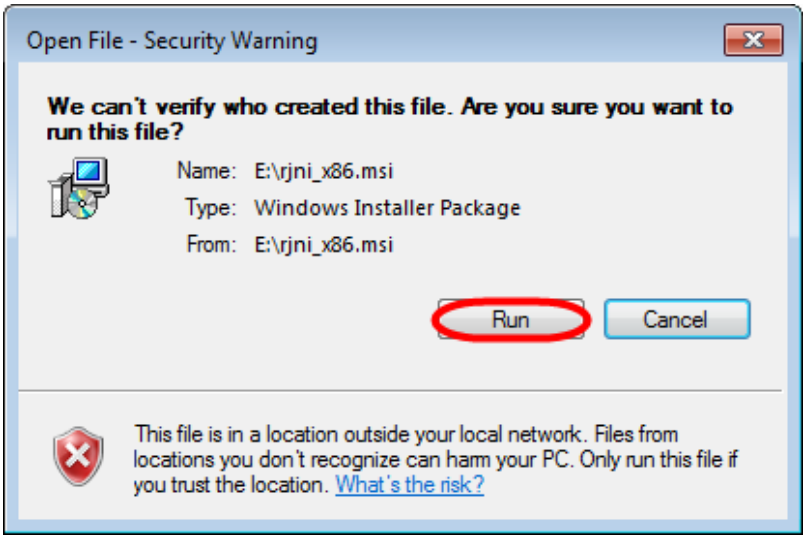

Fig. 1 – security window

Then the screen will display the Setup Wizard Welcome screen, where you should click **Next** (Fig. 2).

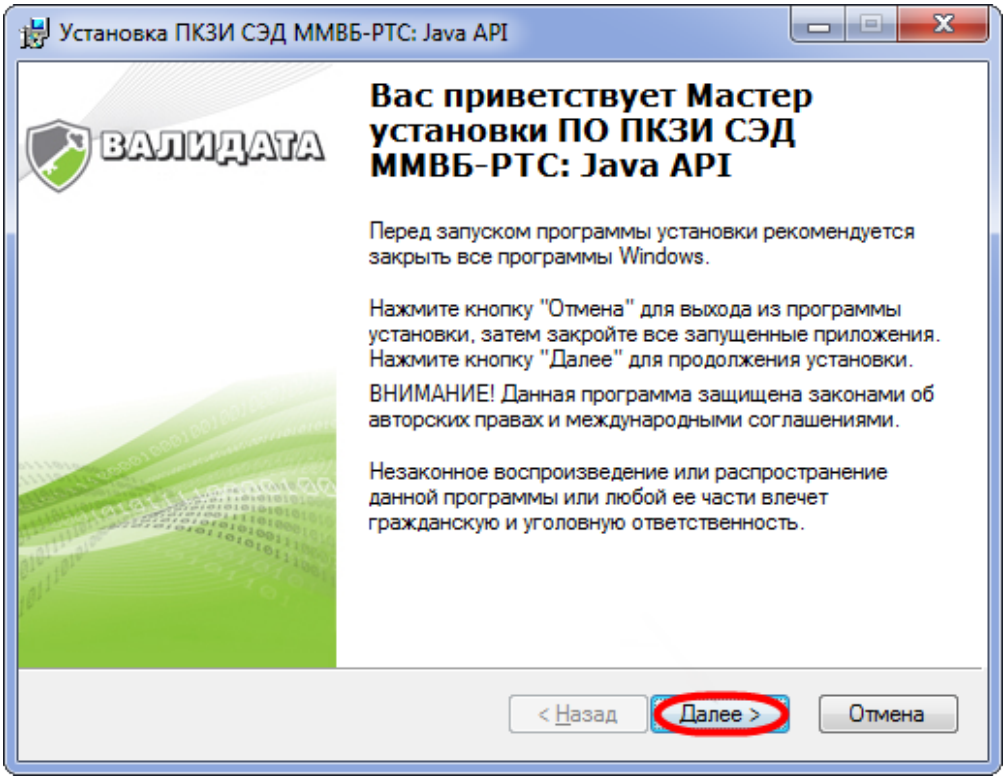

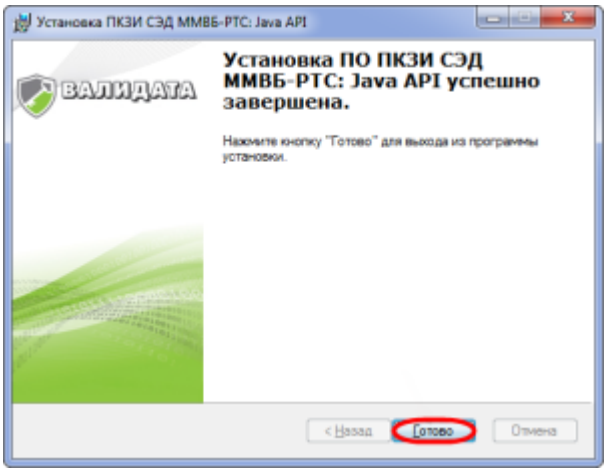

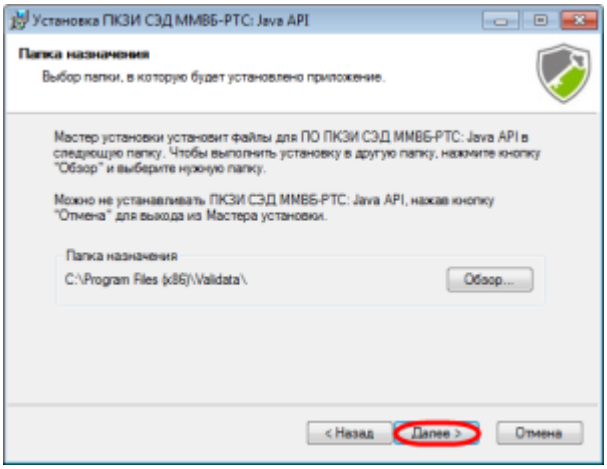

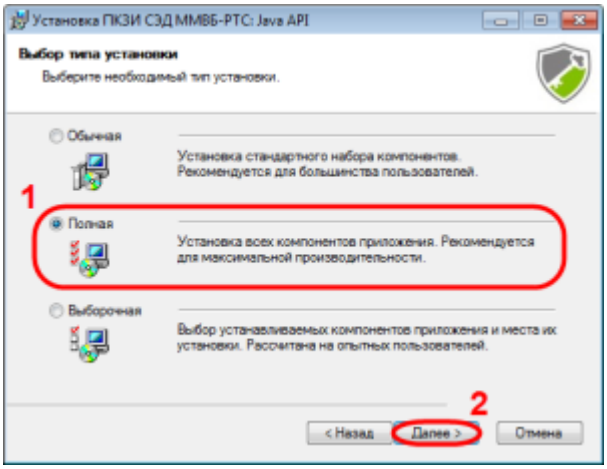

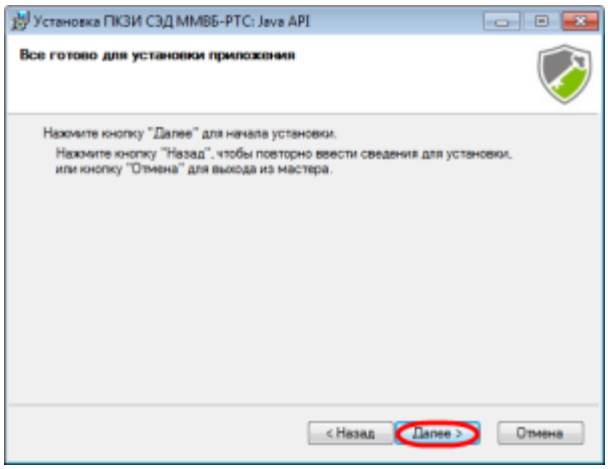

Fig. 2 – start of installation

After that the screen will open dialogs, preparing for installation as described in Table 1.

Table 1 – installation of the Certificates storage

Dialog box	Action
	In this window you will be prompted to enter full name and company name. We recommend skipping this step by clicking on the Next **button**
	In this window you will be asked to specify a destination folder (by default **C:\ Program Files (x86)\ Validata**), using the **Browse** button. We recommend skipping this step by clicking on the **Next** button
	In this window you can select **Full installation** and click **Next**

	In this window click **Next** to start installation

After a few minutes the program will be installed on the computer and a dialog will pop up (Fig. 3), where you need to click **Finish**.

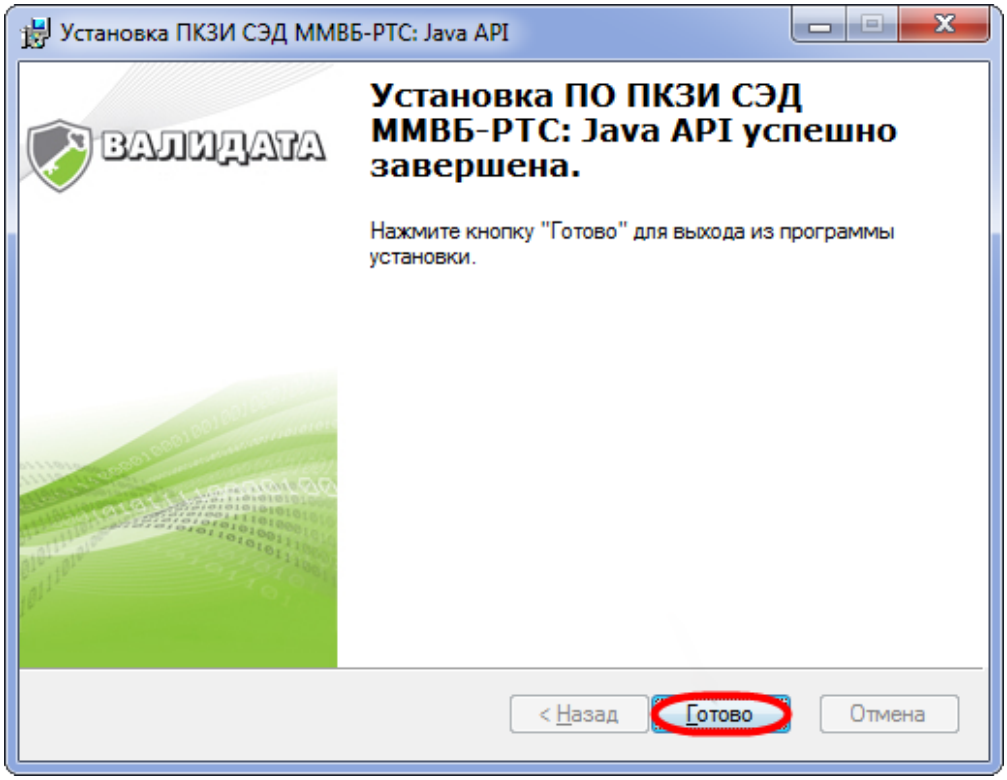

Figure 3 – installation complete

Next, you need to install the Certificates storage.
